SUMMARY

AI engineer who builds agents that make decisions, with around two years across freelance client delivery and internships. Ships agentic systems end to end: a three-stage LLM guardrail agent packaged as an MCP plugin and adopted inside Claude Desktop, Cursor and Codex, multilingual voice agents, and full-stack AI products for 10+ clients. Comfortable owning a feature from prompt and tool design through deployment and evaluation. Looking for an early-stage team where I can build AI-native product.

TECHNICAL SKILLS

- **Agentic and LLM:** agentic workflows, tool and function calling, MCP protocol, LLM guardrails, RAG, LangGraph, prompt engineering, structured outputs.
- **Languages:** Python, TypeScript, JavaScript
- **Full stack:** React, Next.js, FastAPI, Flask, Node.js
- **Data:** PostgreSQL, MongoDB, Supabase, Redis
- **Tooling:** Cursor, Claude Code, Codex, Git, Docker

EXPERIENCE

AI native Software Engineer

May 2025 to Present

Independent Consultant

Remote

- Designed client agent pipelines that chain model calls with tool execution, structured outputs and human-in-the-loop checkpoints, so product teams could launch AI features without hand-holding the model.
- Architected Sentinel, a three-stage LLM safety guardrail agent (rules engine, self-trained classifier, final review pass) packaged as an MCP plugin adopted inside Claude Desktop, Cursor and Codex, holding 76% cross-validation accuracy.
- Worked directly with founders and client teams to scope, demo and iterate on each AI feature, turning broad use-AI-here asks into shipped and testable workflows.
- Owned end-to-end delivery of AI-assisted full-stack products for 10+ clients, spanning agent workflows, tool and API integration, and deployment across React/Next.js and Python/FastAPI/Flask stacks.

Software Developer Intern

Jun 2024 to Jul 2024

IOCL

Guwahati, India, On-site

- Lead contributor on a linear regression forecasting model (scikit-learn, pandas), improving forecast accuracy on live equity market data through iterative feature engineering.
- Automated manual back-office workflows with custom Python and Flask scripts, shrinking processing time by 40% across a multi-person operations team.

Associate Software Engineer

May 2023 to Nov 2023

Synar Technology

Guwahati, India, Remote

- Directed full-cycle development on multiple concurrent client websites, pairing a React.js frontend with a Flask backend from initial requirements through final deployment.
- Lifted organic traffic by 15% and trimmed front-end rendering time 20% via an integrated technical and on-page SEO strategy.

PROJECTS

Sentinel ([Link](#))

LLM guardrail agent, MCP plugin

- Packaged it as an MCP plugin adopted inside Claude Desktop, Cursor and Codex, enforcing tool-calling rules at the protocol layer so it drops into any host with no code changes..
- Trained and evaluated the classifier stage, tuning precision against recall so genuine tool calls were not blocked while unsafe ones were caught.

Daybook ([Link](#))

RAG platform on a local LLM

- Built Debug, a retrieval-augmented generation app running on a local LLM, with an explicit reasoning step before each answer so responses stay grounded in retrieved documents instead of model memory.
- Designed the retrieval layer (chunking, embedding search, ranking) so the model cites the source passages it used, and kept the whole pipeline on-device so documents never leave the machine.
- A private, zero-cloud personal workspace built with Jetpack Compose, Material 3, SQLCipher, and on-device machine intelligence.

Browserpilot ([Link](#))

In active development

TypeScript, Next.js, React, PostgreSQL, Redis, Playwright, Google Gemini, DeepSeek, Puter.js, Tailwind CSS, SSE

- Architected an autonomous 6-layer agentic discovery engine using Antigravity Technology (AGT) that harvests 2,500+ employer ATS portals (Greenhouse, Lever, Ashby, YC) via multi-model routing (Gemini, DeepSeek, Puter), delivering a 15-30 role guarantee, DNS MX validation, and live SSE streaming with 0% ghost postings.
- Engineered an in-memory sliding-window Redis cache with atomic FIFO eviction for 10,000 live vacancies, integrated with a 50/50 personalized career memory ranker and AES-256-GCM encrypted browser sandboxes, cutting database query load by 85% while enforcing zero cross-tenant session bleed.

EDUCATION

Bachelor of Technology, Computer Science & Engineering

Guwahati, India

Assam Down Town University
